### 15-251: Great Theoretical Ideas In Computer Science

#### **Recitation 3**

#### **Announcements**

Be sure to take advantage of the following resources:

- Homework Solution Sessions Friday 5p-6p, Saturday 2p-3p in GHC 4301
- Conceptual office hours (no HW help) Friday 6p-8p in Gates 5 Carrel 1
- We will be releasing our grading rubrics from now on to make the learning objectives/takeaways of homework problems explicit.

## **Too Many Definitions**

- Informally, a Turing machine is a machine with a finite set of states, a tape (memory) that is infinite in one direction that can process inputs over some alphabet. At each step, the machine makes the following decisions (based on the state it is in and the symbol it's tape-head is currently reading): move to some state, write some symbol at the current cell currently under the tape head, and move the tape head to the left or to the right.
- Formally, we define a Turing machine to be a 7-tuple  $(Q, q_0, q_{\mathsf{accept}}, q_{\mathsf{reject}}, \Sigma, \Gamma, \delta)$ , where Q is the set of states,  $q_0$  is the start state,  $q_{\mathsf{accept}}$  and  $q_{\mathsf{reject}}$  are the final states,  $\Sigma$  is the input alphabet,  $\Gamma \supseteq \Sigma \cup \{\bot\}$  is the tape alphabet, and  $\delta: Q' \times \Gamma \to Q \times \Gamma \times \{L, R\}$ , where  $Q' = Q \setminus \{q_{\mathsf{accept}}, q_{\mathsf{reject}}\}$  is the transition function.
- Countability cheat sheet: You are given a set A. Is it countable or uncountable?

$$|A| < |\mathbb{N}|$$
 (A is countable)

- Show directly an injection from A to  $\mathbb{N}$   $(A \hookrightarrow \mathbb{N})$  or a surjection from  $\mathbb{N}$  onto A  $(\mathbb{N} \twoheadrightarrow A)$
- Show  $|A| \leq |B|$ , where B is one of  $\mathbb{Z}$ ,  $\mathbb{Z} \times \mathbb{Z}$ ,  $\mathbb{Q}$ ,  $\Sigma^*$  ,  $\mathbb{Q}[x]$ , etc.

$$|A| > |\mathbb{N}|$$
 (A is uncountable)

- Show directly using a diagonalization argument.
- Show that  $|\{0,1\}^{\infty}| \leq |A|$ , i.e. an injection from  $\{0,1\}^{\infty}$  to A.

# **Counting sheep**

For each set below, determine if it is countable or not. Prove your answers.

- (a)  $S = \{a_1 a_2 a_3 \ldots \in \{0,1\}^{\infty} \mid \forall n \geq 1 \text{ the string } a_1 \ldots a_n \text{ contains more 1's than 0's.} \}.$
- (b)  $\Sigma^*$ , where  $\Sigma$  is an alphabet that is allowed to be countably infinite (e.g.,  $\Sigma = \mathbb{N}$ ).

<sup>&</sup>lt;sup>a</sup>This one is important and very powerful

### **Closure Ceremony**

Suppose that  $L_1$  and  $L_2$  are decidable languages. Show that the languages  $L_1 \cdot L_2$  and  $L_1^*$  are decidable as well.<sup>1</sup>

## Not Just Your Regular Old TM

Suppose we change the definition of a TM so that the transition function has the form

$$\delta: Q \times \Gamma \to Q \times \Gamma \times \{R, S\}$$

where the meaning of S is "stay". That is, at each step, the tape head can move one cell to the right or stay in the same position. Suppose M is a TM of this new kind, and suppose also that M is a decider. Show that L(M) is a regular language.

# (Extra) Only \$19.99! Call now!

Dr. Hyper Turing Machines Inc LLC is selling a whole host of new Turing machines, each for \$19.99:

- Bi-infinite TMs with a tape that stretches infinitely in both directions!
- Infinitely-scalable TMs choose however many tapes heads you like!
- Quad-core TMs now with 4 tapes (each with its own tape head)

Normal TMs usually go for \$9.99 these days. Your friend (who's not very Turing-savvy) is in the market for a new Turing machine and just texted you asking you for purchasing advice. Your instincts tell you that maybe most of this is marketing hype. But some of those improvements do sound pretty compelling... Your friend doesnt use their TM for all that much - mostly just browsing the web and checking email. What should you recommend them to do?

# (Bonus) Tick Tock Clock

Write a Turing Machine that does the following: given an input string  $s \in \{0,1\}^*$ , the Turing machine should finish with a binary representation of |s| on the tape (and nothing else). The TM should run in time at most  $c_1|s|\log|s|+c_2$  steps, where  $c_1,c_2$  are some constants.

<sup>&</sup>lt;sup>1</sup>Exercise : show that  $L_1 \cup L_2$  and  $L_1 \cap L_2$  are also decidable.
